

# Java: Methods & Strings

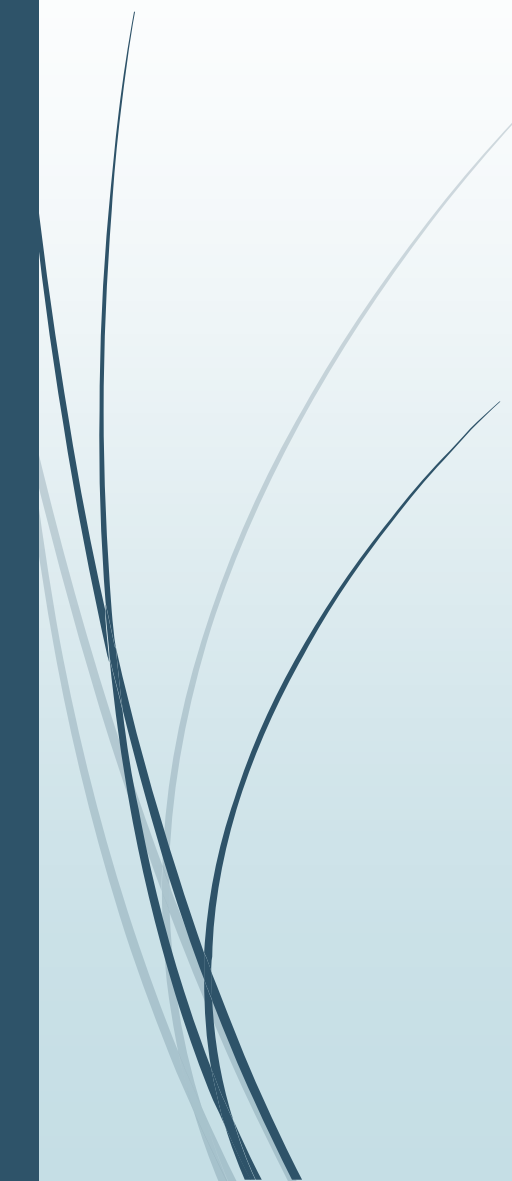

**B.Sc. 2<sup>nd</sup> Semester**

**Department of Computer Science and Applications (Paper Code:CC3)**

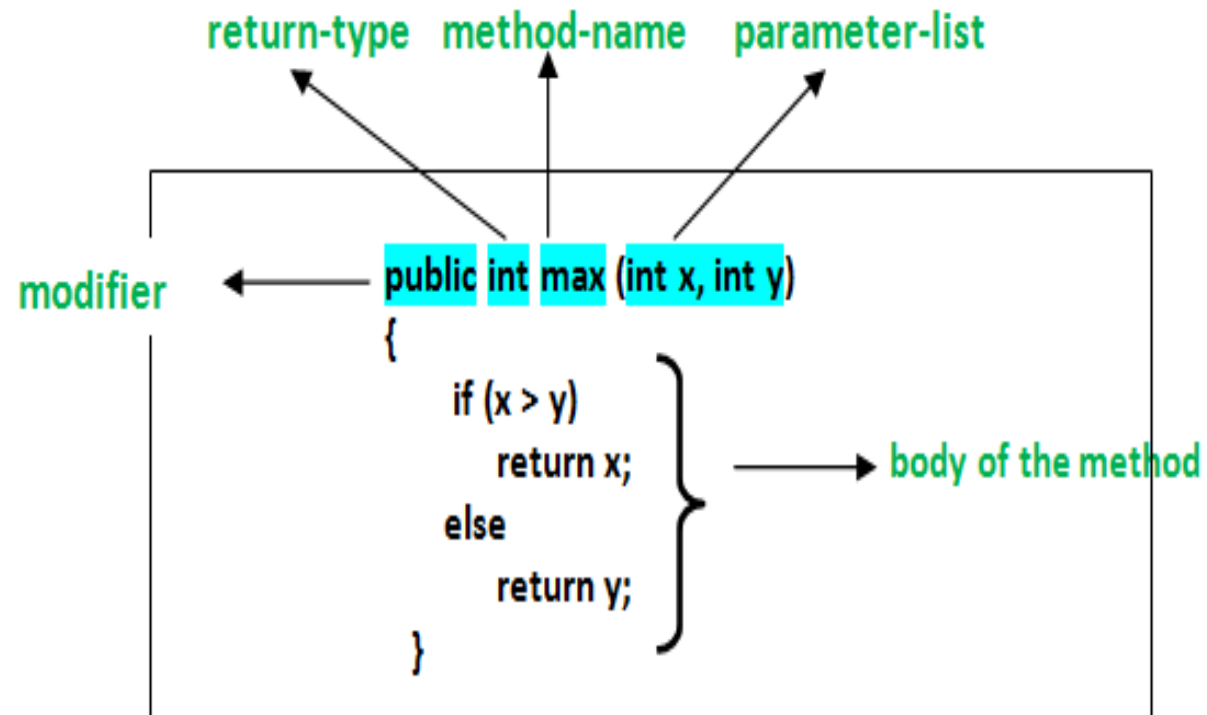

**Prof. Paulami Basu Ray**

# Contents

- ▶ Methods
  - ▶ String Class
  - ▶ Command Line Arguments
  - ▶ Common Methods of the String Class
- 

# Method

# Method

- ▶ A method is a collection of statements that perform some specific task and return the result to the caller. A method can perform some specific task without returning anything. Methods allow us to **reuse** the code without retyping the code. In Java, every method must be part of some class which is different from languages like C, C++.  
Methods are **time savers** and help us to **reuse** the code without retyping the code.

- ▶ **Method Declaration**

In general, method declarations has six components :

# Method

**1. Modifier-** Defines **access type** of the method i.e. from where it can be accessed in your application. In Java, there 4 type of the access specifiers.:

- public: accessible in all class in your application.
- protected: accessible within the class in which it is defined and in its **subclass(es)**
- private: accessible only within the class in which it is defined.
- default (declared/defined without using any modifier) : accessible within same class and package within which its class is defined.

# Method

- 2. The return type** : The data type of the value returned by the method or void if does not return a value.
- 3. Method Name** : The rules for field names apply to method names as well, but the convention is a little different.
- 4. Parameter list** : Comma separated list of the input parameters are defined, preceded with their data type, within the enclosed parenthesis. If there are no parameters, you must use empty parentheses ().
- 5. Exception list** : The exceptions you expect by the method can throw, you can specify these exception(s). [This is optional]
- 6. Method body** : It is enclosed between braces. The code you need to be executed to perform your intended operations.

# Strings

- ▶ The String class represents character strings. All string literals in Java programs, such as "abc", are implemented as instances of this class.
- ▶ Strings are constant; their values cannot be changed after they are created.
- ▶ String buffers support mutable strings. Because String objects are immutable they can be shared.

- ▶ For example:

```
String str = "abc";
```

is equivalent to:

```
char data[] = {'a', 'b', 'c'};
```

```
String str = new String(data);
```

- ▶ Here are some more examples of how strings can be used:

```
System.out.println("abc");
```

```
String cde = "cde";
```

```
System.out.println("abc" + cde);
```

# String Conversions

- Try to compile the following code:

```
class StrConvert{  
    public static void main(String args[]){  
        String strTest="100";  
        System.out.println("Using String:"+(strTest/4));  
    }  
}
```

Error!

Bad operand types for binary operator

# String Conversions

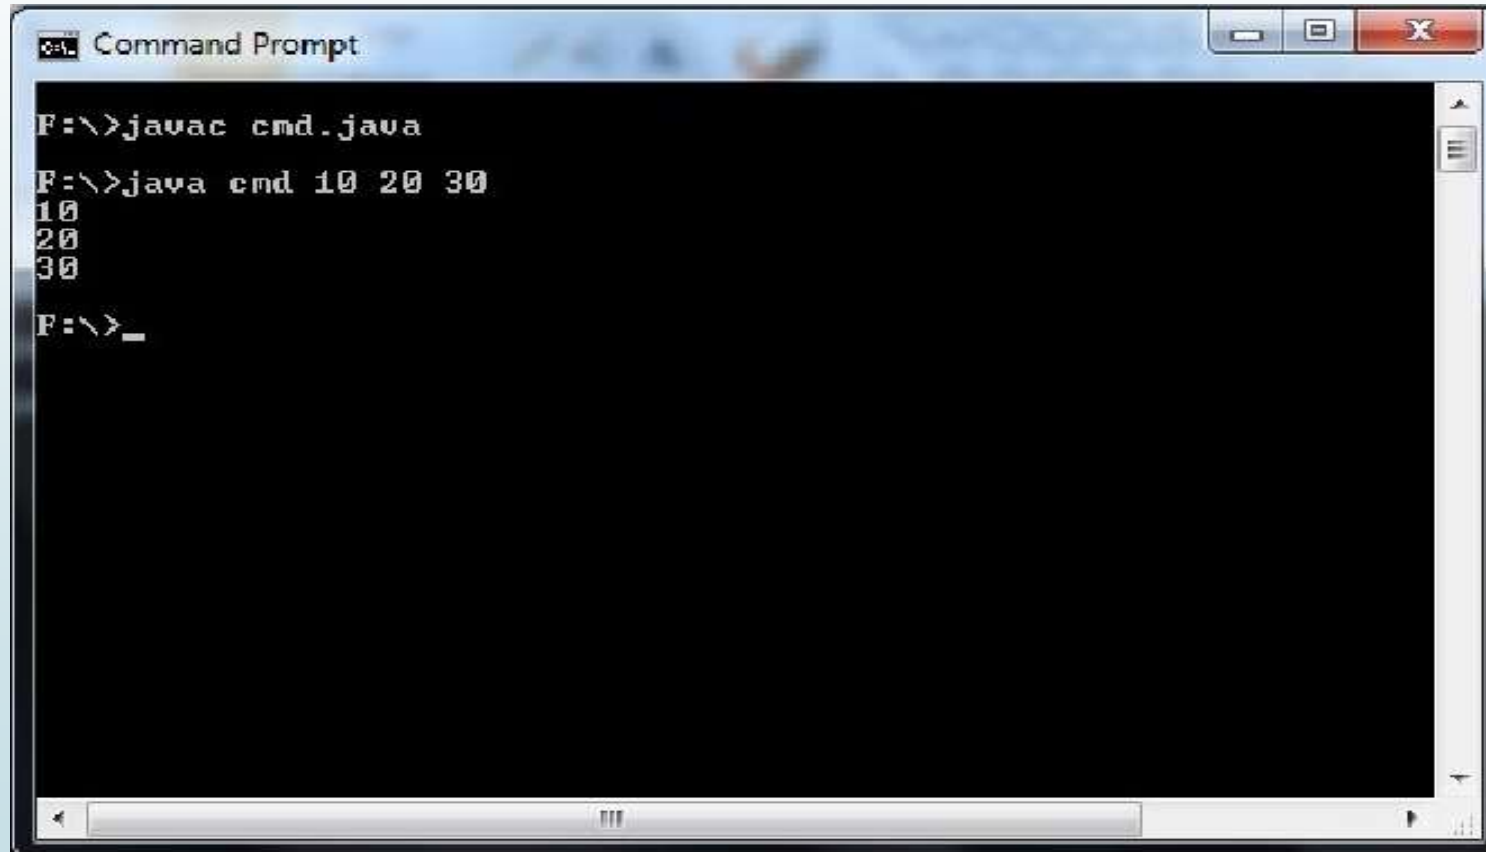

```
class StrConvert
{
    public static void main(String []args)
    {
        String strTest = "100";
        int IntTest = Integer.parseInt(strTest);
        System.out.println("Actual String:"+ strTest);
        System.out.println("Converted to Int:" + iTest); //This will now show arithmetic op
        System.out.println("Arithmetic Operation on Int: " + (iTest/4));
    }
}
```

# Command Line Arguments

- ▶ A **command-line argument** is an information that directly follows the program's name on the **command line** when it is executed.

```
class cmd
{
    public static void main(String[] args)
    {
        for(int i=0;i< args.length;i++)
        {
            System.out.println(args[i]);
        }
    }
}
```

# Command Line Arguments

```
F:\>javac cmd.java
F:\>java cmd 10 20 30
10
20
30
F:\>_
```

The screenshot shows a Windows Command Prompt window titled "Command Prompt". The window has a standard Windows title bar with minimize, maximize, and close buttons. The command prompt shows the following sequence of commands and output:

- `F:\>javac cmd.java`: Compiles the Java file `cmd.java`.
- `F:\>java cmd 10 20 30`: Executes the Java program `cmd` with three command line arguments: `10`, `20`, and `30`.
- The output of the program is displayed on three separate lines: `10`, `20`, and `30`.
- The prompt returns to `F:\>_` after the execution.

# String Class Methods

Method	Description
<a href="#"><code>char charAt(int index)</code></a>	returns char value for the particular index
<a href="#"><code>int length()</code></a>	returns string length
<a href="#"><code>String substring(int beginIndex)</code></a>	returns substring for given begin index.
<a href="#"><code>String substring(int beginIndex, int endIndex)</code></a>	returns substring for given begin index and end index.
<code>Boolean contains(CharSequence s)</code>	returns true or false after matching the sequence of char value.
<a href="#"><code>boolean equals(Object another)</code></a>	checks the equality of string with the given object.
<a href="#"><code>boolean isEmpty()</code></a>	checks if string is empty.
<code>String concat(String str)</code>	concatenates the specified string.
<a href="#"><code>static String equalsIgnoreCase(String another)</code></a>	compares another string. It doesn't check case.
